

**HITFIST® 25-30mm  
LIGHT TURRET FOR INFANTRY FIGHTING VEHICLE  
(FIRE IN SMALL TURRET)**

HITFIST® is a two-man, power operated turret armed with a 25 or 30mm automatic cannon, a 7.62mm coaxial machine gun and two elevation controlled TOW missile launchers (option).

The turret is built with ballistic aluminium alloy and additional steel armour plates to reach the required protection level.

The new HITFIST® fire control system (together with the TOW guidance set) allows engagement of targets by day and night; the electrical, fully digital servosystems and the line of fire stabilization ensure a high accuracy of fire. Crew consists of two men who sit side by side in the turret: the commander on the left, the gunner on the right.

A single man can fully operate the turret.

The main armament is an automatic cannon of 25 or 30mm, electrically controlled for elevation, traversing and firing operations; feeding is through belted rounds housed in two ammunition containers.

Assembly and disassembly of the weapon do not require special tools, thus making control and servicing operations possible in unfavourable conditions.

Cannon control is through the HITFIST® fire control system which includes a sight with eye-safe laser rangefinder and a thermal night vision camera.

A 7.62mm machine gun is coaxially mounted to the main cannon. Two TOW armoured launchers are side-mounted on the turret with remote control (Digital Missile Guidance Set) integrated in the HITFIST® fire control system.
